1.1.1. Calculate Momentum

Write a program that accepts the mass of an object (in kilograms) and its velocity (in meters per second), then calculates and displays the momentum of the object. The momentum p is calculated using the formula:
$$p = m \times v$$

where:
 m is the mass of the object (in kilograms).
 v is the velocity of the object (in meters per second).
Input Format:

- A single floating-point number representing the mass of the object in kilograms.
- A single floating-point number representing the velocity of the object in meters per second.

Output Format:

- The output will display calculated momentum with appropriate units (kgm/s) (rounded up to 2 decimal places).

Sample Test Cases

calculate...

```
1 # Accept mass and velocity as input
2 mass = float(input())
3 velocity = float(input())
4
5 # calculate momentum
6 momentum = mass * velocity
7
8 # display result rounded to 2 decimal places with Unit
9 print(f"momentum:.2f)kgm/s")
```

1.1.2. Conditional Calculation Based on the Number of Digits

Write a Python program that accepts an integer n as input. Depending on the number of digits in n .
Constraints:
 $1 \leq n \leq 999$
Input Format:

- The input consists of a single integer n .

Output Format:

- If n is a single-digit number, print its square.
- If n is a two-digit number, print its square root (rounded to two decimal places).
- If n is a three-digit number, print its cube root (rounded to two decimal places).
- Else print "Invalid".

Sample Test Cases

condition...

```
1 import math
2
3 # Accept input
4 num = int(input())
5
6 # Check number of digitals and perform StopIteration
7 if 1 <= num <= 9:
8     print(num ** 2)
9
10 elif 10 <= num <= 99:
11     print(f"{math.sqrt(num):.2f}")
12
13 elif 100 <= num <= 999:
14     print(f"{math.cbrt(num):.2f}")
15
16 else:
17     print("Invalid")
```

1.1.4. Reverse a Number

Write a Python program to reverse the digits of the number and print the reversed number.

Input Format:

The input is a single integer.

Output Format:

The output prints a single integer, which is the reversed number.

Sample Test Cases

reverseN...

```
1 number = int(input())
2
3 reversed = 0
4
5 while number > 0:
6     digit = number % 10
7     reversed = reversed * 10 + digit
8     number = number // 10
9
10 print(reversed)
```

1.1.3. Days between Two Dates

Write a Python program to calculate number of days between two dates.

Input Format:

The first line contains the first date in the format `YYYY-MM-DD`.
The second line contains the second date in the format `YYYY-MM-DD`.

Output Format:

An integer representing the number of days between the given dates.

Note:

The first date should always be considered earlier than the second date.

Sample Test Cases

noOfDay...

```
1 from datetime import date
2
3 from datetime import datetime
4
5 date1 = input().strip()
6 date2 = input().strip()
7
8 d1 = datetime.strptime(date1, "%Y-%m-%d")
9 d2 = datetime.strptime(date2, "%Y-%m-%d")
10
11 difference = d2 - d1
12
13 print(difference.days)
```

1.1.8. Multiplication Table

Write a Python program that takes an integer as input and prints the multiplication table for that integer from 1 to 10.

Input Format:

The first line of input contains an integer that represents the number for which the multiplication table is to be printed.

Output Format:

Print the multiplication table for the given number in the format:

<number> x <multiplier> = <result>

Note:

The character "x" is used in the output to represent multiplication.
Refer to the visible test-cases for more clarity.

Sample Test Cases

multiplia...

```
1 num = int(input())
2 for i in range(1,11):
3     print(f"{num} x {i} = {num * i}")
4
```

1.2.1. Pass or Fail

Write a Python program that accepts the number of courses and the marks of a student in those courses. The grade is determined based on the aggregate percentage:

- If the aggregate percentage is greater than 75, the grade is Distinction.
- If the aggregate percentage is greater than or equal to 60 but less than 75, the grade is First Division.
- If the aggregate percentage is greater than or equal to 50 but less than 60, the grade is Second Division.
- If the aggregate percentage is greater than or equal to 40 but less than 50, the grade is Third Division.

Input Format:

- The first input will be an integer n , the number of courses.
- The second input will be n integers representing the marks of the student in each of the n courses, separated by a space.

Output Format:

If the student passes all courses:

- Print the aggregate percentage (formatted to two decimal places).
- Print the grade based on the aggregate percentage.

If the student fails any course (marks < 40 in any course), print:

- "Fail".

Note:

- Aggregate Percentage: Average performance across all courses, calculated by summing all marks and dividing by the number of courses.

Sample Test Cases

passorFa...

```
17 # Fail or Pass
18 else:
19     # Calculate aggregate percentage
20     aggregate = sum(marks) / n
21     # Print aggregate percentage (2 decimal places)
22     print(f"Aggregate Percentage: {aggregate:.2f}")
23     # Determine grade
24     if aggregate > 75:
25         print("Grade: Distinction")
26     elif 60 <= aggregate < 75:
27         print("Grade: First Division")
28     elif 50 <= aggregate < 60:
29         print("Grade: Second Division")
30     elif 40 <= aggregate < 50:
31         print("Grade: Third Division")
```

1.2.2. Fibonacci Series

Write a Python program that uses recursion to print the first n terms of the Fibonacci series.

Input Format:

- A single integer n representing the number of terms to generate.

Output Format:

- A single line containing the first n terms of the Fibonacci sequence, separated by spaces.

Sample Test Cases

fibonacci...

```
1 def fibonacci(n):
2     if n == 1:
3         return 0
4     elif n == 2:
5         return 1
6     else:
7         # write the code..
8
9     return fibonacci(n-1) + fibonacci(n-2)
10
11
12 n = int(input())
13 for i in range(1, n + 1):
14     print(fibonacci(i), end=" ")
15

1.2.3. Pattern - 1

Write a Python program to print a pattern of asterisks in the form of a right-angled triangle.

Input Format:

- The input is an integer, representing the number of rows in the pattern.

Output Format

- The output should display the pattern of asterisks (*), with each row containing an increasing number of asterisks.

Note: Refer to the displayed test cases for the sample pattern.

Sample Test Cases

rightangl...

```
1 # Input: number of rows
2 n = int(input())
3
4 # Print pattern
5 for i in range(1, n + 1):
6     for j in range(i):
7         print("*", end=" ")
8     print()
