PRN : 202501050062

Batch : CH3

Subject : EDS

Screenshot Of Practical No.2 :

Practical Lab Assignment :

The first screenshot shows the CodeTANTRA IDE interface for a Python program titled "listOps.py". The program implements a menu-driven interface for managing a list of integers. The menu options are: 1. Add, 2. Remove, 3. Display, 4. Quit. The program repeatedly prompts the user to enter a choice from the menu. The test results show that 2 out of 2 shown test case(s) passed and 1 out of 1 hidden test case(s) passed. The test case 1 output shows the expected output and actual output for the menu options and user input.

The second screenshot shows the CodeTANTRA IDE interface for a Python program titled "DictOper...". The program implements a menu-driven interface for managing a dictionary of student records. The menu options are: 1. Insertion, 2. Update, 3. Deletion, 4. Traversal. The program repeatedly prompts the user to enter a choice from the menu. The test results show that 2 out of 2 shown test case(s) passed and 2 out of 2 hidden test case(s) passed. The test case 1 output shows the expected output and actual output for the menu options and user input.

2.2.1. Linear search Technique

Write a program to check whether the given element is present or not in the array of elements using linear search.

Input format:

- The first line of input contains the array of integers which are separated by space
- The last line of input contains the key element to be searched

Output format:

- If the element is found, print the index. If the element found multiple times, print the starting index
- If the element is not found, print **Not found**.

Sample Test Case:

Input:
1 2 3 4 3 5 6
3
Output:
2

Sample Test Cases

CTP1709...

```
1 # Input: array elements
2 arr = list(map(int, input().split()))
3
4 # Input: key to search
5 key = int(input())
6
7 # Linear search
8 found = False
9 for i in range(len(arr)):
10     if arr[i] == key:
11         print(i)
12         found = True
13         break
14
15 # If not found
16 if not found:
17     print("Not found")
```

2.2.2. Captain of the Team

You are provided with the heights of 11 cricket players (in centimeters). Your task is to identify the tallest player, who will be selected as the captain of the team.

Input Format:

The first line of input will contain 11 integers, each representing the height of a player (in centimeters), each separated by a space.

Output Format

The output should be the height (in centimeters) of the tallest player.

Sample Test Cases

captainof...

```
1 # Input: heights of 11 players
2 heights = list(map(int, input().split()))
3
4 # Find tallest player
5 tallest = max(heights)
6
7 # Output
8 print(tallest)
9
```
